This product is for laboratory research ONLY and not for diagnostic use

Introduction:

GenJet™ In Vitro DNA Transfection Reagent (Ver. II) is upgraded version of GenJet™ In Vitro DNA Transfection Reagent. With a new chemistry, more DNA condensing groups were released in the new version compared with old version GenJet™, leading to 3-20 times more efficient in DAN delivery. In combination of a proprietary transfection toxicity removal cocktail, GenJet™ In Vitro Transfection Kit (Ver. II) for Saos-2 is pre-optimized and pre-conditioned for maximally transfecting Saos-2 cells without visible cell death.

Contents Per Kit:

- 1. 1 x 1.0 ml of GenJet™ DNA Transfection Reagent for Saos-2 Cell.
- 2. 1 x 8.0 ml (5x) of GenJet™ Transfection Buffer.

Procedures for Transfecting Saos-2 Cell:

Step I. Preparation of Working Solution of GenJet™ Transfection Buffer

GenJet^{\mathbb{M}} Transfection Buffer (5x) is provided as 5 times concentrated stock solution. To make working solution, dilute one part of the stock solution with 4 parts of ddH2O. The 1x GenJet^{\mathbb{M}} Transfection Buffer is table at 4 OC-RT for 24 months.

Note: Always keep GenJet™ Transfection Buffer (5x) at RT. If refrigerated, white precipitates may appear. It won't affect the transfection efficiency. After dilution with 4 parts of ddH2O to make GenJet™ Transfection Buffer (1x) working solution, the white precipitates will disappear.

Step 2. Cell Seeding (see Table 1):

Cells should be plated 18 to 24 hours prior to transfection so that the monolayer cell density reaches to the optimal ~70% confluency at the time of transfection. Complete culture medium with serum and antibiotics is freshly added to each well ~60 minutes before transfection.

Table 1. A Guideline for Seeding Adherent Cells Prior to Transfection in Different Culture Formats

Culture Dishes	Surface Area (cm²)	Number of Cells to Seed
T75 Flask	75	3.0 - 6.0 x 10 ⁶
100 mm Dish	58	2.2 - 4.4 x 10 ⁶
60 mm Dish	21	0.9 - 1.8 x 10 ⁶
35 mm Dish	9.6	3.5 - 7.0 x 10 ⁵
6-well Plate	9.6	4.0 - 8.0 x 10 ⁵
12-well Plate	3.5	1.5 - 3.0 x 10 ⁵
24-well Plate	1.9	0.8 - 1.6 x 10 ⁵
48-well Plate	1.0	4.0 - 8.0 x 10 ⁴
96-well Plate	0.3	1.2 - 2.4 x 10 ⁴

Step 3. Preparation of GenJet™-DNA Complex and Transfection Procedures

For Saos-2 cell, the optimal ratio of GenJet[™] (μ L):DNA (μ g) is 2.25:1. To ensure the optimal size of complex particles, we recommend using 1x GenJet[™] Transfection Buffer to dilute DNA and GenJet[™] Reagent.

The following protocol is given for transfection in 6-well plate, refer to <u>Table 2</u> for transfection in other culture formats. The optimal transfection conditions for Saos-2 are given in the standard protocol described below.

Table 2. Recommended Amounts for Different Culture Vessel Formats

Culture Dish	Culture Medium (ml)	Plasmid DNA (µg)	Transfection Buffer (1x) (mL)	GenJet™ Reagent (μL)
96-well	0.1	0.1	0.010	0.225
48-well	0.25	0.25	0.025	0.5625
24-well	0.5	0.5	0.050	1.125
6-well	1	2.0	0.20	4.50
35 mm dish	1	2.0	0.20	4.50
60 mm dish	3	4.0	0.40	9.0
10 cm dish	6	10	1.0	22.5
T75 flask	6	11	1.1	24.75

- For each well, dilute 2.0 μg of DNA into 200 μl of 1xGenJet™ Transfection Buffer prepared from <u>Step 1</u>. Pipetting up and down to mix.
- Add 4.5 μl of GenJet™ reagent (Ver. II) into the diluted plasmid DNA. Vortex briefly to mix.
- Incubate for ~10 min at room temperature to allow GenJet $^{\text{\tiny{TM}}}\textsc{-}$ DNA complexes to form.

Note: Never keep GenJet™-DNA complexes longer than 20 min.

- Add the 200 μ l GenJet^m/ DNA complex drop-wise onto the cell culture and homogenize the mixture by gently swirling the plate.
- Remove DNA/GenJet[™] complex-containing medium after overnight incubation followed by addition of complete serum/antibiotics containing medium.
- Check transfection efficiency 24 to 48 hours post transfection.

Storage: GenJet $^{\rm IM}$ In Vitro Transfection Kit is stable for up to 12 months at 4 $^{\rm O}$ C. This item shipped at ambient temperature
